How to host your website on ClamV

Step 1:

First, you need to log in to the server from your own computer. You'll use a command-line tool for this.

* **On Windows:** Open **PowerShell** or **Command Prompt**.

* **On Mac/Linux:** Open the **Terminal** app.

Type the following command, but replace username with the actual username you were given. Then press Enter.

```
ssh username@10.60.36.1

**For this Please use the credentials IT provided you via email.**

**### Step 2:**

Once you're logged in, you are in your "home" directory. The server is configured
to only show web content that is placed inside a special folder called
public\_html.

To move into that folder, use the cd (change directory) command:

cd public\_html

**### Step 3:**

Now, you need to copy your website files (like index.html, style.css, etc.) from
your computer to the server's public\_html folder. The easiest way to do this is
with the scp (secure copy) command.

Important: You must run this command in a new Terminal or PowerShell window on
your local computer, not in the window connected to the server.
```

To copy a single file: Replace your-file.html with your filename and username with your username.

2 / 3

```
scp ~/your-file.html username@10.60.36.1:~/public\_html/
```

```
for a full folder use the -r (recursive) flag
```

```
scp -r /path/to/your/my-website username@10.60.36.1:~/public\_html/
```

Step 4:

You can now open your website with

http://10.60.36.1/~username
